

### PROBLEM 1.13

**KNOWN:** Masonry wall of known thermal conductivity has a heat rate which is 75% of that through a composite wall of prescribed thermal conductivity and thickness.

**FIND:** Thickness of masonry wall.

**SCHEMATIC:**

**ASSUMPTIONS:** (1) Both walls subjected to same surface temperatures, (2) One-dimensional conduction, (3) Steady-state conditions, (4) Constant properties.

**ANALYSIS:** For steady-state conditions, the conduction heat flux through a one-dimensional wall follows from Fourier's law, Eq. 1.2,

$$q'' = k \frac{\Delta T}{L}$$

where  $\Delta T$  represents the difference in surface temperatures. Since  $\Delta T$  is the same for both walls, it follows that

$$L_1 = L_2 \frac{k_1}{k_2} \cdot \frac{q_2''}{q_1''}.$$

With the heat fluxes related as

$$q_1'' = 0.75q_2''$$

$$L_1 = 90 \text{ mm} \times \frac{0.70 \text{ W/m}\cdot\text{K}}{0.20 \text{ W/m}\cdot\text{K}} \times \frac{1}{0.75} = 420 \text{ mm} \quad <$$

**COMMENTS:** Not knowing the temperature difference across the walls, we cannot find the value of the heat rate.
